4th of July 2017
Boolean Functions and Their Applications

The content of this talk is based on joint works with Biryukov, Canteaut, Duval, Khovratovich and Udovenko, and my [PhD thesis](#).

If you only know the Look-Up Table of an S-Box,
what can you do?

If you only know the Look-Up Table of an S-Box, what can you do?

Random?

Was it picked uniformly at
random?

If you only know the Look-Up Table of an S-Box, what can you do?

Random?

Was it picked uniformly at random?

Structured?

Was it built using a particular structure ?

S-Box?

An S-Box is a small non-linear function mapping m bits to n usually specified via its look-up table.

S-Box?

An S-Box is a small non-linear function mapping m bits to n usually specified via its look-up table.

- Typically, $n = m$, $n \in \{4, 8\}$
- Used by many block ciphers/hash functions/stream ciphers.
- Necessary for the wide trail strategy.

Example

$\pi' = (252, 238, 221, 17, 207, 110, 49, 22, 251, 196, 250, 218, 35, 197, 4, 77, 233, 119, 240, 219, 147, 46, 153, 186, 23, 54, 241, 187, 20, 205, 95, 193, 249, 24, 101, 90, 226, 92, 239, 33, 129, 28, 60, 66, 139, 1, 142, 79, 5, 132, 2, 174, 227, 106, 143, 160, 6, 11, 237, 152, 127, 212, 211, 31, 235, 52, 44, 81, 234, 200, 72, 171, 242, 42, 104, 162, 253, 58, 206, 204, 181, 112, 14, 86, 8, 12, 118, 18, 191, 114, 19, 71, 156, 183, 93, 135, 21, 161, 150, 41, 16, 123, 154, 199, 243, 145, 120, 111, 157, 158, 178, 177, 50, 117, 25, 61, 255, 53, 138, 126, 109, 84, 198, 128, 195, 189, 13, 87, 223, 245, 36, 169, 62, 168, 67, 201, 215, 121, 214, 246, 124, 34, 185, 3, 224, 15, 236, 222, 122, 148, 176, 188, 220, 232, 40, 80, 78, 51, 10, 74, 167, 151, 96, 115, 30, 0, 98, 68, 26, 184, 56, 130, 100, 159, 38, 65, 173, 69, 70, 146, 39, 94, 85, 47, 140, 163, 165, 125, 105, 213, 149, 59, 7, 88, 179, 64, 134, 172, 29, 247, 48, 55, 107, 228, 136, 217, 231, 137, 225, 27, 131, 73, 76, 63, 248, 254, 141, 83, 170, 144, 202, 216, 133, 97, 32, 113, 103, 164, 45, 43, 9, 91, 203, 155, 37, 208, 190, 229, 108, 82, 89, 166, 116, 210, 230, 244, 180, 192, 209, 102, 175, 194, 57, 75, 99, 182).$

The Two Tables

Let $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ be an S-Box.

The Two Tables

Let $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ be an S-Box.

Definition (DDT)

The *Difference Distribution Table* of S is a matrix of size $2^n \times 2^n$ such that

$$\text{DDT}[a, b] = \#\{x \in \mathbb{F}_2^n \mid S(x \oplus a) \oplus S(x) = b\}.$$

The Two Tables

Let $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ be an S-Box.

Definition (DDT)

The *Difference Distribution Table* of S is a matrix of size $2^n \times 2^n$ such that

$$\text{DDT}[a, b] = \#\{x \in \mathbb{F}_2^n \mid S(x \oplus a) \oplus S(x) = b\}.$$

Definition (LAT)

The *Linear Approximations Table* of S is a matrix of size $2^n \times 2^n$ such that

$$\text{LAT}[a, b] = \#\{x \in \mathbb{F}_2^n \mid x \cdot a = S(x) \cdot b\} - 2^{n-1} = \frac{\mathcal{W}_S(a, b)}{2}$$

Coefficient Distribution in the DDT

If an n -bit S-Box is bijective, then its **DDT** coefficients behave like **independent** and identically distributed random variables following a Poisson distribution:

$$\Pr [\text{DDT}[a, b] = 2z] = \frac{e^{-1/2}}{2^z z} .$$

Coefficient Distribution in the DDT

If an n -bit S-Box is bijective, then its **DDT** coefficients behave like **independent** and identically distributed random variables following a Poisson distribution:

$$\Pr [\text{DDT}[a, b] = 2z] = \frac{e^{-1/2}}{2^z z} .$$

- Always even, ≥ 0
- Typically between 0 and 16 (for $n =$)
- Lower is better.

Coefficient Distribution in the LAT

If an n -bit S-Box is bijective, then its **LAT** coefficients behave like **independent** and identically distributed random variables following this distribution:

$$\Pr [\text{LAT}[a, b] = 2z] = \frac{\binom{2^{n-1}}{2^{n-2+z}}}{\binom{2^n}{2^{n-1}}}.$$

Coefficient Distribution in the LAT

If an n -bit S-Box is bijective, then its **LAT** coefficients behave like **independent** and identically distributed random variables following this distribution:

$$\Pr [\text{LAT}[a, b] = 2z] = \frac{\binom{2^{n-1}}{2^{n-2+z}}}{\binom{2^n}{2^{n-1}}}.$$

- Always even, signed.
- Typically between -40 and 40 (for $n = 8$).
- Lower absolute value is better.

Taking Number of Maximum Values into Account

Application of this Analysis?

We applied this method on the S-Box of Skipjack.

What is Skipjack?

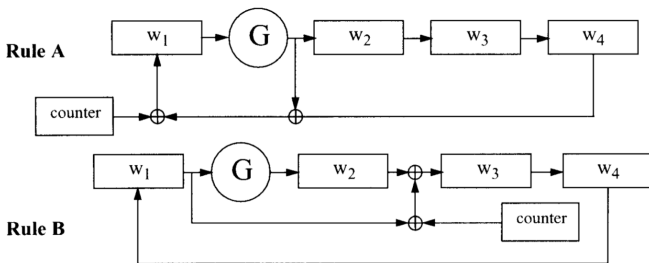

Type Block cipher

Bloc 64 bits

Key 80 bits

Authors NSA

Publication 1998 (classified at first)

Reverse-Engineering the S-Box of Skipjack

Skipjack uses F , a permutation of \mathbb{F}_2^8 with $\max(\text{LAT}) = 28$ and $\#28 = 3$.

Reverse-Engineering the S-Box of Skipjack

Skipjack uses F , a permutation of \mathbb{F}_2^8 with $\max(\text{LAT}) = 28$ and $\#28 = 3$.

Reverse-Engineering the S-Box of Skipjack

Reverse-Engineering the S-Box of Skipjack

Skipjack uses F , a permutation of \mathbb{F}_2^8 with $\max(\text{LAT}) = 28$ and $\#28 = 3$.

$$\Pr[\max(\text{LAT}) = 28 \text{ and } \#28 \leq 3] \approx 2^{-55}$$

What Can We Deduce?

- F has not been picked uniformly at random.
- F has not been picked among a feasibly large set of random S-Boxes.
- Its linear properties were optimized (though poorly).

What Can We Deduce?

Attacks Against SPN (1/2)

Attacks Against SPN (1/2)

Attacks Against SPN (1/2)

$$\bigoplus_{j=0}^{2^m-1} S_{2,i}(y_i^j) = 0, \text{ for all } i.$$

Attacks Against SPN (1/2)

$\bigoplus_{j=0}^{2^m-1} S_{2,i}(y_i^j) = 0$, for all i . Repeat for different constant then solve system [Biryukov, Shamir, 2001]

Attacks Against SPN (2/2)

Works against more than 3 rounds if $\deg(S(AS)^{r-1})$ is low enough.

Attacks Against SPN (2/2)

Works against more than 3 rounds if $\deg(S(AS)^{r-1})$ is low enough.

Degree Bound (SPN) [Biryukov et al., 2017]

Let σ operate on m bits, $\deg(\sigma) = m - 1$, and n be the block size.
Roughly speaking, $\deg(S(AS)^{r-1}) < n - 1$ as long as

$$(m - 1)^{\lfloor r/2 \rfloor} < n .$$

Attacks Against Feistel Networks

Degree Bound (Feistel Network) [Perrin and Udovenko, 2016]

Let $\{F_i\}_{i < r}$ be permutations of $\mathbb{F}_2^{n/2}$ of degree d and let $\mathcal{F}^r(F)$ denote the r -round n -bit Feistel Network with round function F_i . If

$$d^{\lfloor r/2 \rfloor - 1} + d^{\lceil r/2 \rceil - 1} < n,$$

then some degree $n - 1$ terms in the ANF of $\mathcal{F}^r(F)$ are missing.

What Does it Take to Have Full Degree?

The degree based distinguishers for SPNs and Feistel networks can be seen as particular cases of this lemma.

Lemma

Let $F : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be a Boolean function and let $G : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ be a permutation. Then:

$$\deg(F \circ G) = n - 1 \implies \deg(F) + \deg(G^{-1}) \geq n .$$

 - Definition of the TU-decomposition
 - Application to the Last Russian Standards
- 4 A Decomposition of the 6-bit APN Permutation
- 5 Conclusion

What is the TU-Decomposition?

The *TU-decomposition* is a decomposition algorithm working against vast groups of algorithms: 3-round Feistel, Dillon's APN permutation, SAS, ...

T and U are mini-block ciphers ; μ and η are linear permutations.

TU-Decomposition in a Nutshell

Let \mathcal{L} be the LAT of the target $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$.

TU-Decomposition in a Nutshell

Let \mathcal{L} be the LAT of the target $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$.

- 1 Identify vector spaces \mathcal{U} and \mathcal{V} of dimension $n/2$ such that:

$$\mathcal{L}(a, b) = 0, \forall (a, b) \in \mathcal{U} \times \mathcal{V}.$$

TU-Decomposition in a Nutshell

Let \mathcal{L} be the LAT of the target $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$.

- 1 Identify vector spaces \mathcal{U} and \mathcal{V} of dimension $n/2$ such that:

$$\mathcal{L}(a, b) = 0, \forall (a, b) \in \mathcal{U} \times \mathcal{V}.$$

- 2 Deduce linear permutations μ' and η' such that

$$\mathcal{L}(\mu'(a), \eta'(b)) = 0, \forall (a, b) \in \mathbb{F}_2^{n/2} \times \mathbb{F}_2^{n/2}$$

TU-Decomposition in a Nutshell

Let \mathcal{L} be the LAT of the target $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$.

- 1 Identify vector spaces \mathcal{U} and \mathcal{V} of dimension $n/2$ such that:

$$\mathcal{L}(a, b) = 0, \forall (a, b) \in \mathcal{U} \times \mathcal{V}.$$

- 2 Deduce linear permutations μ' and η' such that

$$\mathcal{L}(\mu'(a), \eta'(b)) = 0, \forall (a, b) \in \mathbb{F}_2^{n/2} \times \mathbb{F}_2^{n/2}$$

- 3 Built new LAT \mathcal{L}' such that

$$\mathcal{L}'(a, b) = \mathcal{L}(\mu'(a), \eta'(b))$$

and recover S' with LAT \mathcal{L}' . Deduce μ, η .

TU-Decomposition in a Nutshell

Let \mathcal{L} be the LAT of the target $S : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$.

- 1 Identify vector spaces \mathcal{U} and \mathcal{V} of dimension $n/2$ such that:

$$\mathcal{L}(a, b) = 0, \forall (a, b) \in \mathcal{U} \times \mathcal{V}.$$

- 2 Deduce linear permutations μ' and η' such that

$$\mathcal{L}(\mu'(a), \eta'(b)) = 0, \forall (a, b) \in \mathbb{F}_2^{n/2} \times \mathbb{F}_2^{n/2}$$

- 3 Built new LAT \mathcal{L}' such that

$$\mathcal{L}'(a, b) = \mathcal{L}(\mu'(a), \eta'(b))$$

and recover S' with LAT \mathcal{L}' . Deduce μ, η .

Bootstrapping TU-Decomposition

OK... But how do we find \mathcal{U} and \mathcal{V} ?

Bootstrapping TU-Decomposition

OK... But how do we find \mathcal{U} and \mathcal{V} ?

For now: we just look at the LAT and hope for the best!

- 5 Conclusion

The Big APN Problem

Definition (APN function)

A function $f : \mathbb{F}_2^m \rightarrow \mathbb{F}_2^m$ is **Almost Perfect Non-linear (APN)** if

$$f(x \oplus a) \oplus f(x) = b$$

has 0 or 2 solutions for all $a \neq 0$ and for all b .

The Big APN Problem

Definition (APN function)

A function $f : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ is **Almost Perfect Non-linear (APN)** if

$$f(x \oplus a) \oplus f(x) = b$$

has 0 or 2 solutions for all $a \neq 0$ and for all b .

Big APN Problem

Are there APN permutations operating on \mathbb{F}_2^n where n is even?

Dillon et al.'s Permutation

Only One Known Solution!

For $n = 6$, Dillon et al. found an APN permutation.

Dillon et al.'s Permutation

Only One Known Solution!

For $n = 6$, Dillon et al. found an APN permutation.

Dillon et al.'s Permutation

Only One Known Solution!

For $n = 6$, Dillon et al. found an APN permutation.

Dillon et al.'s Permutation

Only One Known Solution!

For $n = 6$, Dillon et al. found an APN permutation.

It is possible to make a TU-decomposition!

On the Butterfly Structure

Definition (Open Butterfly $H_{\alpha, \beta}^3$)

This permutation is an **open butterfly**.

On the Butterfly Structure

Definition (Open Butterfly $H_{\alpha,\beta}^3$)

This permutation is an **open butterfly**.

Lemma

Dillon's permutation is affine-equivalent to $H_{w,1}^3$, where $\text{Tr}(w) = 0$.

CCZ-equivalence (1/2)

Definition (CCZ-equivalence)

Let F and G be functions of \mathbb{F}_2^n . They are **CCZ-equivalent** if there exists a linear permutation L of $\mathbb{F}_2^n \times \mathbb{F}_2^n$ such that

$$\{(x, F(x)), \forall x \in \mathbb{F}_2^n\} = \{L(x, G(x)), \forall x \in \mathbb{F}_2^n\}$$

CCZ-equivalence (1/2)

Definition (CCZ-equivalence)

Let F and G be functions of \mathbb{F}_2^n . They are **CCZ-equivalent** if there exists a linear permutation L of $\mathbb{F}_2^n \times \mathbb{F}_2^n$ such that

$$\{(x, F(x)), \forall x \in \mathbb{F}_2^n\} = \{L(x, G(x)), \forall x \in \mathbb{F}_2^n\}$$

Properties

CCZ-equivalence preserves:

- the distribution of the coefficients in the LAT (Walsh spectrum),
- the distribution of the coefficients in the DDT.

It does **not** preserve:

- the position of the DDT/LAT coefficients
- the algebraic degree.

Closed Butterflies

Definition (Closed butterfly $V_{\alpha, \beta}^3$)

This quadratic function is a **closed butterfly**.

Closed Butterflies

Definition (Closed butterfly $V_{\alpha, \beta}^3$)

This quadratic function is a **closed butterfly**.

Lemma (Equivalence)

Open and closed butterflies with the same parameters are CCZ-equivalent.

Butterflies and Feistel Networks

When $\alpha = 1$, butterflies can be greatly simplified.

Some Properties of Butterflies

Theorem (Properties of butterflies [Canteaut et al., 2017])

Let $V_{\alpha,\beta}^3$ and $H_{\alpha,\beta}^3$ be butterflies operating on $2n$ bits, n odd. Then:

- $\deg(V_{\alpha,\beta}^3) = 2$,
- if $n = 3$, $\text{Tr}(\alpha) = 0$ and $\beta + \alpha^3 \in \{\alpha, 1/\alpha\}$, then
 $\max(\text{DDT}) = 2$, $\max(\mathcal{W}) = 2^{n+1}$ and $\deg(H_{\alpha,\beta}^3) = n + 1$,
- if $\beta = (1 + \alpha)^3$, then
 $\max(\text{DDT}) = 2^{n+1}$, $\max(\mathcal{W}) = 2^{(3n+1)/2}$ and $\deg(H_{\alpha,\beta}^3) = n$,
- otherwise,
 $\max(\text{DDT}) = 4$, $\max(\mathcal{W}) = 2^{n+1}$ and $\deg(H_{\alpha,\beta}^3) \in \{n, n + 1\}$
 and $\deg(H_{\alpha,\beta}^3) = n$ if and only if

$$1 + \alpha\beta + \alpha^4 = (\beta + \alpha + \alpha^3)^2.$$

- 5 Conclusion**

Plan of this Section

- 1 Introduction
- 2 Overview of S-Box Reverse-Engineering Methods
- 3 The TU-Decomposition
- 4 A Decomposition of the 6-bit APN Permutation
- 5 Conclusion**

Conclusion

- We can recover the majority of known S-Box structures and derive new results about Skipjack and Kuznyechik.

Conclusion

- We can recover the majority of known S-Box structures and derive new results about Skipjack and Kuznyechik.
- We can generalize the permutation of Dillon et al...

Conclusion

- We can recover the majority of known S-Box structures and derive new results about Skipjack and Kuznyechik.
- We can generalize the permutation of Dillon et al...
- but we can prove that our generalizations are **never** APN (except in the known case).

Conclusion

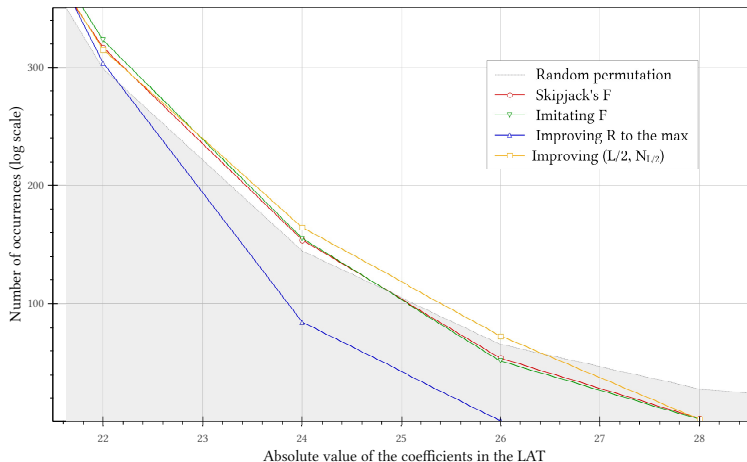

- We can recover the majority of known S-Box structures and derive new results about Skipjack and Kuznyechik.
- We can generalize the permutation of Dillon et al...
- but we can prove that our generalizations are **never** APN (except in the known case).
- There are still S-Boxes with unknown building strategies (CMEA, CSS)!

The Last S-Box

Details About Skipjack

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Let $I_i : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be such that $I_i(x) = 1 \Leftrightarrow x \in C_i$:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{x \in \mathbb{F}_2^n} F(G(x)) \times I_i(x),$$

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Let $I_i : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be such that $I_i(x) = 1 \Leftrightarrow x \in C_i$:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{x \in \mathbb{F}_2^n} F(G(x)) \times I_i(x),$$

and let $y = G(x)$. Then:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{y \in \mathbb{F}_2^n} F(y) \times I_i(G^{-1}(y)).$$

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Let $I_i : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be such that $I_i(x) = 1 \Leftrightarrow x \in C_i$:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{x \in \mathbb{F}_2^n} F(G(x)) \times I_i(x),$$

and let $y = G(x)$. Then:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{y \in \mathbb{F}_2^n} F(y) \times I_i(G^{-1}(y)).$$

This sum is equal to 1 if and only if $x \mapsto F(x) \times I_i(G^{-1}(x))$ has degree n .

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Let $I_i : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be such that $I_i(x) = 1 \Leftrightarrow x \in C_i$:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{x \in \mathbb{F}_2^n} F(G(x)) \times I_i(x),$$

and let $y = G(x)$. Then:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{y \in \mathbb{F}_2^n} F(y) \times I_i(G^{-1}(y)).$$

This sum is equal to 1 if and only if $x \mapsto F(x) \times I_i(G^{-1}(x))$ has degree n .
 I_i is affine ($I_i(x) = 1 + x_i$).

Proof of Full Degree Condition

If $\deg(F \circ G) = n - 1$, then $\exists i \leq n$ such that $\bigoplus_{x \in C_i} (F \circ G)(x) = 1$.

Let $I_i : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ be such that $I_i(x) = 1 \Leftrightarrow x \in C_i$:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{x \in \mathbb{F}_2^n} F(G(x)) \times I_i(x),$$

and let $y = G(x)$. Then:

$$\bigoplus_{x \in C_i} (F \circ G)(x) = \bigoplus_{y \in \mathbb{F}_2^n} F(y) \times I_i(G^{-1}(y)).$$

This sum is equal to 1 if and only if $x \mapsto F(x) \times I_i(G^{-1}(x))$ has degree n . I_i is affine ($I_i(x) = 1 + x_i$). Thus, the sum can be equal to 1 only if

$$\deg(F) + \deg(G^{-1}) \geq n.$$
